The Skybase Concept

Enter data through an access-controlled bespoke **interface screen** with dropdown boxes, auto-complete options and other easy to use and intuitive controls. Or receive data via a simple webform.

This data becomes a **database record**, which can hold uploaded files, attachments, curated task lists, time-stamped journal entries and two-email email communications.

Database records can be **linked** to records from other databases. For example, a record in a Projects database can be linked to the relevant client in a Clients database. Viewing the Client record would then show all Projects linked to that client.

Database records can be **viewed** in filtered tables, drag-and-drop kanban boards, consolidated calendars and many different types of reports.
